Reaction Mechanisms - AP Chemistry

A reaction mechanism is a series of steps involved in a chemical reaction. A reaction mechanism is comprised of a series of elementary steps. These steps are termed as unimolecular (involving one molecule, bimolecular (involving two molecules) and termolecular (involving three molecules) - which are first order, second order and third order, respectively. Reaction mechanisms must . Add up to yield overall balanced equation.

Chemistry happens in the world around you, not just in a lab. Matter interacts to form new products through a process called a chemical reaction or chemical change. Every time you cook or clean, it's chemistry in action. Your body lives and grows thanks to chemical reactions. There are reactions when you take medications, light a match, and draw a breath.

Examples of Chemical Reactions in Everyday Life

A combination reaction produces a certain substance; a combustion reaction is a vigorous reaction, usually a combination with oxygen, that is accompanied by the production of light and/or heat. In a decomposition reaction, a single substance reacts to make multiple substances as products.

5.4: Some Types of Chemical Reactions - Chemistry LibreTexts

A chemical reaction is a process generally characterized by a chemical change in which the starting materials (reactants) are different from the products. Chemical reactions tend to involve the motion of electrons, leading to the formation and breaking of chemical bonds. There are several different types of chemical reactions and more than one way of classifying them.
